INVARIANTS OF EXECUTION

► In the course of its execution, a program passes through different states.

- ► In the course of its execution, a program passes through different states.
- The state of a program at the beginning of the execution and at its end may be very different.

- ► In the course of its execution, a program passes through different states.
- The state of a program at the beginning of the execution and at its end may be very different.
- Finding a denotation to a program = assigning to it an invariant of execution (*i.e.* an object that must the same for all its states).

- ► In the course of its execution, a program passes through different states.
- The state of a program at the beginning of the execution and at its end may be very different.
- Finding a denotation to a program = assigning to it an invariant of execution (*i.e.* an object that must the same for all its states).
- ► The denotation of a program gives us some informations about its behaviour. Usually, **dynamical information** (related to its execution).

- ► In the course of its execution, a program passes through different states.
- The state of a program at the beginning of the execution and at its end may be very different.
- Finding a denotation to a program = assigning to it an invariant of execution (*i.e.* an object that must the same for all its states).
- ► The denotation of a program gives us some informations about its behaviour. Usually, **dynamical information** (related to its execution).
- ► Usually, the information by a denotation implies that the concerned program is **terminating**.

- ► In the course of its execution, a program passes through different states.
- The state of a program at the beginning of the execution and at its end may be very different.
- Finding a denotation to a program = assigning to it an invariant of execution (*i.e.* an object that must the same for all its states).
- ► The denotation of a program gives us some informations about its behaviour. Usually, **dynamical information** (related to its execution).
- ► Usually, the information by a denotation implies that the concerned program is **terminating**.
- Another use of denotations: equating or separating programs *i.e.* two states that have different denotations cannot be instances of the same program.

TYPES AS INVARIANTS OF EXECUTION

• λ -terms: programs, β -reduction step: execution step.

TYPES AS INVARIANTS OF EXECUTION

- λ -terms: programs, β -reduction step: execution step.
- Normalizability: termination.

Many variants: head-n, weak-n, strong-n,...

TYPES AS INVARIANTS OF EXECUTION

- λ -terms: programs, β -reduction step: execution step.
- Normalizability: termination.

Many variants: head-n, weak-n, strong-n,...

Types: check statically (without reducing) that a term is normalizable (soundness of a type system).

TYPES AS INVARIANTS OF EXECUTION

- λ -terms: programs, β -reduction step: execution step.
- Normalizability: termination.

Many variants: head-n, weak-n, strong-n,...

- Types: check statically (without reducing) that a term is normalizable (soundness of a type system).
- Typing: assigning formulas (called *types*) to variables.
 The type of a λ-term can be computed, if some *typing rules* are respected.

TYPES AS INVARIANTS OF EXECUTION

- λ -terms: programs, β -reduction step: execution step.
- Normalizability: termination.

Many variants: head-n, weak-n, strong-n,...

- Types: check statically (without reducing) that a term is normalizable (soundness of a type system).
- Typing: assigning formulas (called *types*) to variables.
 The type of a λ-term can be computed, if some *typing rules* are respected.
- When a type system enjoys subject reduction and expansion, types are execution invariants (and they usually provide us with models of λ-calculus).

NON-TERMINATING PROGRAMS

Often given an "empty" denotation (a model that equates all the non-terminating terms is said to be sensible). However:

NON-TERMINATING PROGRAMS

- Often given an "empty" denotation (a model that equates all the non-terminating terms is said to be sensible). However:
- Not all non-terminating programs are *meaningless*.
 (For instance, streams, a program keeping on printing the list of prime numbers, fixpoint combinators...)

NON-TERMINATING PROGRAMS

- Often given an "empty" denotation (a model that equates all the non-terminating terms is said to be sensible). However:
- Not all non-terminating programs are *meaningless*.
 (For instance, streams, a program keeping on printing the list of prime numbers, fixpoint combinators...)
- Some programs are non terminating but **productive**.

NON-TERMINATING PROGRAMS

- Often given an "empty" denotation (a model that equates all the non-terminating terms is said to be sensible). However:
- Not all non-terminating progams are *meaningless*.
 (For instance, streams, a program keeping on printing the list of prime numbers, fixpoint combinators...)
- ► Some programs are non terminating but **productive**.
- Many possible definitions or variants of sound non termination Klop and alii[95], Endrullis, Polonsky and alii[15]

CONTRIBUTIONS

Using type theory, we build a **completely unsound** type system and a **non-sensible model** of pure λ -calculus in which:

- Every term has a non-empty denotation (including the mute terms).
- Terms are discriminated according to their order (the maximal number of abs that prefixes a reduct).

CONTRIBUTIONS

Using type theory, we build a **completely unsound** type system and a **non-sensible model** of pure λ -calculus in which:

- Every term has a non-empty denotation (including the mute terms).
- Terms are discriminated according to their order (the maximal number of abs that prefixes a reduct).

Related works

- Jacopino[75]: easy terms (*t* is easy if it can be consistently equated to any other term)
- ► Berarducci[96]: **mute** terms ("The most undefined terms").
- ► Bucciarelli,Carraro,Favro,Salibra[15]: *Graph easy Sets of mute lambda terms*, TCS.

(UN)SOUNDNESS

• If a Type System is able to type a non (weakly) head-normalizing term (*e.g.* $\Omega = \Delta \Delta$), it is said here to be **unsound**.

(UN)SOUNDNESS

- If a Type System is able to type a non (weakly) head-normalizing term (*e.g.* $\Omega = \Delta \Delta$), it is said here to be **unsound**.
- If a Type System is able to type every term, it is said to be completely unsound.

(UN)SOUNDNESS

- If a Type System is able to type a non (weakly) head-normalizing term (*e.g.* $\Omega = \Delta \Delta$), it is said here to be **unsound**.
- If a Type System is able to type every term, it is said to be completely unsound.
- With SR and SE, a completely unsound type system should yield a model for pure λ-calculus.

Typing Rules of \mathscr{R}_0 (Gardner/de Carvalho)

Types (
$$\tau$$
, σ_i **):** τ , σ_i := $o \in \mathscr{O} \mid [\sigma_i]_{i \in I} \to \tau$.

Context (Γ , Δ): assign *intersection* types to variables.

$$\frac{\overline{x: [\tau] \vdash x: \tau}}{x: [\tau] \vdash x: \tau} \xrightarrow{\text{ax}} \frac{\Gamma, x: [\sigma_i]_{i \in I} \vdash t: \tau}{\Gamma \vdash \lambda x.t: [\sigma_i]_{i \in I} \to \tau} \xrightarrow{\text{abs}} \frac{\Gamma \vdash t: [\sigma_i]_{i \in I} \to \tau}{\Gamma \vdash_{i \in I} \Delta_i \vdash tu: \tau} \xrightarrow{\text{app}}$$

Examples:

$$\frac{\overline{x:[\tau] \vdash x:\tau}}{\vdash \lambda x.x:[\tau] \to \tau} \text{ abs } \frac{\overline{x:[\tau] \vdash x:\tau}}{x:[\tau] \vdash \lambda y.x:[] \to \tau} \text{ abs}$$

Relevance vs Irrelevance

Observation: In system *R*₀, λx.x (resp. λy.x) can only be typed with a type of the form [τ] → τ (resp. [] → τ).

Relevance vs Irrelevance

- Observation: In system *R*₀, λx.x (resp. λy.x) can only be typed with a type of the form [τ] → τ (resp. [] → τ).
- System \mathscr{R}_0 is said to be **relevant**: *weakening* is not allowed.

Relevance vs Irrelevance

- Observation: In system *R*₀, λx.x (resp. λy.x) can only be typed with a type of the form [τ] → τ (resp. [] → τ).
- ► System *R*₀ is said to be **relevant**: *weakening* is not allowed. For instance, a type is used when it is assigned:

 $\overline{x:[\sigma]\vdash x:\sigma}$ ax

Relevance vs Irrelevance

- Observation: In system *R*₀, λx.x (resp. λy.x) can only be typed with a type of the form [τ] → τ (resp. [] → τ).
- ► System \mathscr{R}_0 is said to be **relevant**: *weakening* is not allowed. For instance, a type is used when it is assigned:

$$\overline{x:[\sigma] \vdash x:\sigma}$$
 ax

► If we replace ax by axw:

$$\frac{i_0 \in I}{\Gamma; \, x: [\sigma_i]_{i \in I} \vdash x: \sigma_{i_0}} \text{ axw}$$

... we obtain an irrelevant system, called $\mathscr{R}_{0,w}$.

◆ロト ◆母 ト ◆臣 ト ◆臣 ト ◆日 ト

Relevance vs Irrelevance

- Observation: In system *R*₀, λx.x (resp. λy.x) can only be typed with a type of the form [τ] → τ (resp. [] → τ).
- ► System *R*₀ is said to be **relevant**: *weakening* is not allowed. For instance, a type is used when it is assigned:

$$\overline{x:[\sigma] \vdash x:\sigma}$$
 ax

► If we replace ax by axw:

$$\frac{i_0 \in I}{\Gamma; \ x : [\sigma_i]_{i \in I} \vdash x : \sigma_{i_0}} \text{ axw}$$

... we obtain an irrelevant system, called $\mathscr{R}_{0,w}$.

• In $\mathscr{R}_{0,w}$, we may derive:

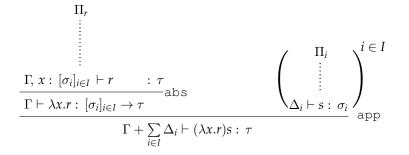

$$\frac{\overline{x:[\tau,\tau_1,\tau_1] \vdash x:\tau}}{\vdash \lambda x.x:[\tau,\tau_1,\tau_2] \to \tau} \text{ abs } \qquad \frac{\overline{x:[\tau],y:[\tau] \vdash x:\tau}}{x:[\tau] \vdash \lambda y.x:[\tau] \to \tau} \text{ abs }$$

SUBJECT REDUCTION PROPERTY FOR \mathscr{R}_0

If $\Pi \rhd \Gamma \vdash t : \tau$ and $t \to t'$, then $\exists \Pi' \rhd \Gamma \vdash t' : \tau$

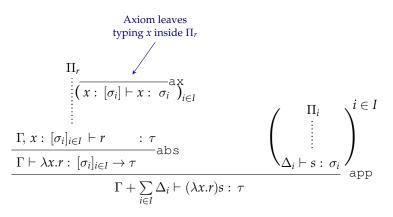

If $\Pi \rhd \Gamma \vdash t : \tau$ and $t \to t'$, then $\exists \Pi' \rhd \Gamma \vdash t' : \tau$

 $(\lambda x.r)s \to r[s/x]$

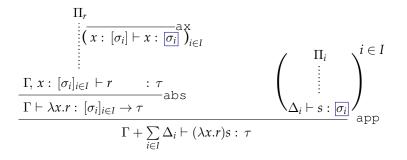

If $\Pi \rhd \Gamma \vdash t : \tau$ and $t \to t'$, then $\exists \Pi' \rhd \Gamma \vdash t' : \tau$

$(\lambda x.r)s \to r[s/x]$

- We define (coinductively) ρ by $\rho = [\rho]_{\omega} \rightarrow \rho$.
- ► Due to irrelevancy, every term is typable in *R_w* (complete unsoundness of *R_w*).
- ► **Claim:** Let *t* be a term. If $\Gamma(x) = [\rho]_{\omega}$ for all free variable *x* of *t*, then $\Gamma \vdash t : \rho$ is derivable in \mathscr{R}_{w} .

COINDUCTIVE TYPE SYSTEMS

- ► We consider two new type systems *R* and *R_w*, having the same rules as *R*₀ and *R_{0,w}*, but using coinductive types.
- We define (coinductively) ρ by $\rho = [\rho]_{\omega} \rightarrow \rho$.
- ► Due to irrelevancy, every term is typable in *R_w* (complete unsoundness of *R_w*).
- ► **Claim:** Let *t* be a term. If $\Gamma(x) = [\rho]_{\omega}$ for all free variable *x* of *t*, then $\Gamma \vdash t : \rho$ is derivable in \mathscr{R}_{w} .

Proof.

$$\frac{\Gamma; x: [\rho]_{\omega} \vdash t: \rho}{\Gamma \vdash \lambda x.t: [\rho]_{\omega} \rightarrow \rho \ (=\rho)}^{\text{abs}}$$
$$\frac{\Gamma \vdash t: \rho \ (= [\rho]_{\omega} \rightarrow \rho) \qquad (\Gamma \vdash u: \rho)_{\omega}}{\Gamma \vdash tu: \rho}$$

Relevant coinductive types

► In \mathscr{R} (relevant), $\lambda y.x$ can still be typed only with types of the form $[] \rightarrow \tau$.

Relevant coinductive types

- ► In \mathscr{R} (relevant), $\lambda y.x$ can still be typed only with types of the form $[] \rightarrow \tau$.
- More generally, if *x* not free in *t* and $\triangleright \Gamma \vdash t : \tau$, then $\tau = [] \rightarrow \tau_0$ for some τ_0 .

Relevant coinductive types

- ► In \mathscr{R} (relevant), $\lambda y.x$ can still be typed only with types of the form $[] \rightarrow \tau$.
- More generally, if *x* not free in *t* and $\triangleright \Gamma \vdash t : \tau$, then $\tau = [] \rightarrow \tau_0$ for some τ_0 .
- ► In *ℛ*, the typing rules constrain [] to appear. Failure of the previous argument.

Relevant coinductive types

- ► In \mathscr{R} (relevant), $\lambda y.x$ can still be typed only with types of the form $[] \rightarrow \tau$.
- More generally, if *x* not free in *t* and $\triangleright \Gamma \vdash t : \tau$, then $\tau = [] \rightarrow \tau_0$ for some τ_0 .
- ► In *ℛ*, the typing rules constrain [] to appear. Failure of the previous argument.
- ► **Question:** what is the set of typable terms in *R* ?

< □ > < @ > < E > < E > E のQ@

Question: what is the set of typable terms in \mathcal{R} ?

▲□▶▲□▶▲□▶▲□▶ □ ● ● ●

Question: what is the set of typable terms in \mathcal{R} ?

► *In the finite case:* type Normal Forms and proceed by expansion.

Question: what is the set of typable terms in \mathcal{R} ?

- ► *In the finite case:* type Normal Forms and proceed by expansion.
- Problem for coinductive Types: no form of normalization is granted (e.g. Ω typable in *R*).

Question: what is the set of typable terms in \mathcal{R} ?

- ► *In the finite case:* type Normal Forms and proceed by expansion.
- Problem for coinductive Types: no form of normalization is granted (e.g. Ω typable in *R*).

We study then **typability** as a first order theory. For that, we resort to another type system S, in which features *pointers*.

Question: what is the set of typable terms in \mathcal{R} ?

- ► *In the finite case:* type Normal Forms and proceed by expansion.
- Problem for coinductive Types: no form of normalization is granted (e.g. Ω typable in *R*).

We study then **typability** as a first order theory. For that, we resort to another type system S, in which features *pointers*. System S collapses on \mathscr{R} . Thus, if every term is typable in S, then every term is typable in \mathscr{R} .

Let $k \ge 2$. We have two cases :

$$C; x: (S_k)_{k \in K} \vdash t: T \quad (\text{pos. } a \cdot 0)$$
$$C \vdash \lambda x.t: (S_k)_{k \in K} \to T \quad (\text{pos. } a)$$

Look at S_7 inside this seq. type.

◆□▶ ◆□▶ ◆豆▶ ◆豆▶ → 豆 → のへで

Let us remind rules ax and abs:

$$\overline{x: (k \cdot T) \vdash x: T}$$
 ax

$$\frac{C \vdash t : T}{C; (S_k)_{k \in K} \vdash \lambda x.t : C(x) \to T} \text{ abs}$$

Let $k \ge 2$. We have two cases :

• First case :

 $x: 7 \cdot S_7 \vdash x: S_7 \text{ (pos. } a')$

$$\frac{C; x: (S_k)_{k \in K} \vdash t: T \quad (\text{pos. } a \cdot 0)}{C \vdash \lambda x.t: (S_k)_{k \in K} \to T \quad (\text{pos. } a)}$$

Look at S_7 inside this seq. type.

(日)

Let us remind rules ax and abs:

$$\overline{x:(k\cdot T)\vdash x:T}$$
 ax

$$\frac{C \vdash t : T}{C; (S_k)_{k \in K} \vdash \lambda x.t : C(x) \to T} \text{ abs}$$

Let $k \ge 2$. We have two cases :

• First case :

 $x: 7 \cdot S_7 \vdash x: S_7 \text{ (pos. } a')$

$$C; x: (S_k)_{k \in K} \vdash t: T \quad (\text{pos. } a \cdot 0)$$
$$C \vdash \lambda x.t: (S_k)_{k \in K} \to T \quad (\text{pos. } a)$$

Look at S_7 inside this seq. type.

We then set: $(a, 7 \cdot c) \rightarrow_{pi} (a', c)$ when $t(a) = \lambda x$

POLAR INVERSION

Let us remind rules ax and abs:

 $\overline{x:\,(k\cdot T)\vdash x:\,T}$ ax

$$\frac{C \vdash t: T}{C; (S_k)_{k \in K} \vdash \lambda x.t: C(x) \to T} \text{ abs}$$

Let $k \ge 2$. We have two cases : Second case :

$$C; x: (S_k)_{k \in K} \vdash t: T \quad (\text{pos. } a \cdot 0)$$

$$C \vdash \lambda x.t: (S_k)_{k \in K} \to T \quad (\text{pos. } a)$$

$$Lecket S$$

Look at S_7 inside this seq. type.

Let us remind rules ax and abs:
